lunar energy

An introduction for homeowners

MEET LUNAR AI

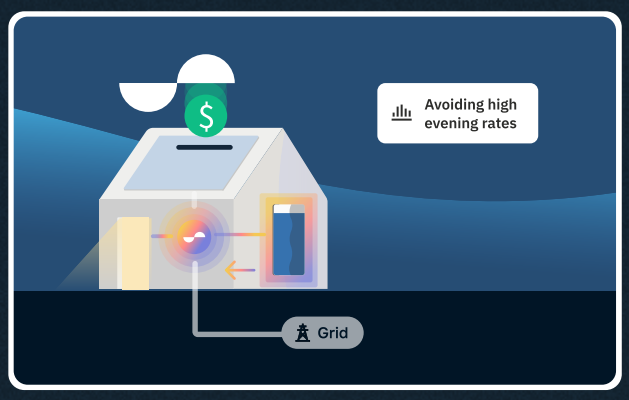

Energy that thinks for itself.

Any battery system can store energy. Only Lunar AI learns, adapts, and acts for you — every single day — weighing weather, rates, EV charging, and VPP opportunities to pick the plan that saves you the most.

How it works

01

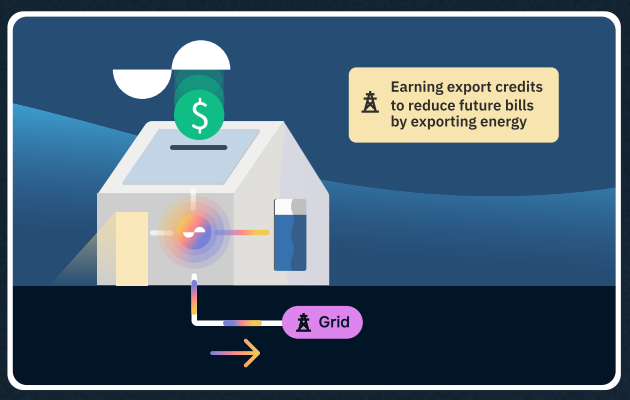

The most expensive electricity is the kind you buy.

Lunar AI fills your battery before evening rates climb — so your home runs on solar long after the sun goes down. Every bit of solar goes straight to the battery. So by 4 PM, you're ready either way.

02

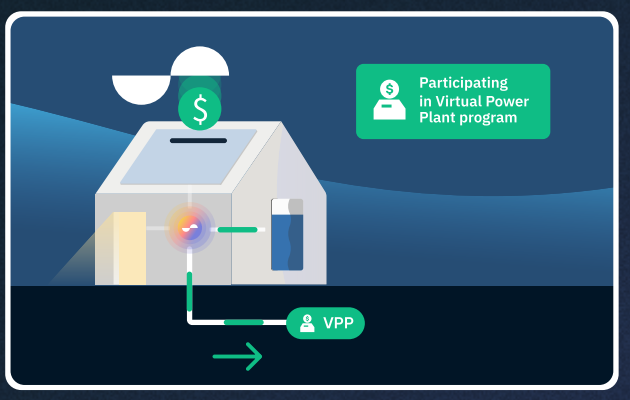

Export credits don't wait. Lunar AI doesn't miss them,

A few hours each summer, the grid pays a premium for your stored power. Lunar AI spots the window, plans around it, and makes sure your battery is ready when the money's good.

03

Every day, a different plan. Always the right one.

Lunar AI weighs your export credits against VPP opportunities and picks the path that saves you the most. The math changes daily. Lunar AI changes with it.

$338+

IN 2025 · PER CUSTOMER · AVERAGE

Additional annual savings, compared to a standard battery mode.

That's Lunar AI paying for a grocery run, every month — without you lifting a finger.

YOUR NEXT STEP

Design the Lunar System that fits your home.
